

North Fork Deer Creek THP

Sheet 1 of 2

Canopy Height Model (LiDAR)

Section 31, T17N R10E MDB&M - Nevada County, California
USGS 3DEP LiDAR, CA_SierraNevada_B22 (2022, QL1), 116 M points in the AOI

0 1,000 2,000 3,000 ft

Scale 1:12,000 (1 in = 1,000 ft)

LEGEND

Canopy height (ft)	Detected tree top with modelled crown (detail)
< 6.5 ft (ground, shrubs)	THP plan area
6.5-20 ft	Harvest unit
20-40 ft	Watercourse (Class I / II)
40-60 ft	Roads
60-80 ft	Cruise plot (piece 2)
80-100 ft	
100-130 ft	
> 130 ft	

STAND TABLE (canopy metrics from the 3 ft CHM; cover = cells $\geq$ 6.5 ft; tops = local maxima $\geq$ 15 ft)

Unit	Ac	Cover %	Mean canopy ht	P95 ht	Max ht	Tops/ac	Tops >40ft/ac	Rumple
1	175	88	66	116	180	38.4	30.9	3.15
2	184	96	74	125	189	37.3	31.8	3.65
3	29	97	96	140	194	32.6	31.5	3.29
4	42	91	81	118	162	34.2	33.1	3.12
5	31	99	64	103	151	40.8	38.4	2.35
6	27	100	95	142	200	31.6	31.0	3.09
7	47	96	87	140	201	34.8	31.5	3.20
Plan	624	93	76	128	201	36.5	31.5	3.29

NOTES

Canopy height model = maximum height above ground of all returns per 3 ft cell, from a ground model interpolated from the vendor's class-2 returns. Heights above 260 ft removed as noise; isolated no-return cells filled from neighbours.
Plan area: canopy cover 93 %, mean canopy height 76 ft, 95th percentile 128 ft, tallest return 201 ft; 22,744 tree tops detected (36/ac, 31/ac over 40 ft).
Tree tops are local maxima of a median-smoothed CHM in a window whose radius grows with height ($0.07 \times \text{height} + 5$ ft). Counts represent the visible overstory; understory and clumped crowns are undercounted, as with any CHM method.
The cruise plots are the piece-2 grid; the LiDAR plot metrics table (1/10-acre circles) is the predictor set an area-based model would be fitted to if real cruise data existed.
