

A. Canopy cover, 30 ft cells

B. Dominant height (95th percentile), 60 ft cells

C. Tree tops over 40 ft per acre, 100 ft cells

D. Rumple index (canopy roughness), 60 ft cells

North Fork Deer Creek THP

Canopy Cover and Structure (LiDAR)

Section 31, T17N R10E MDB&M - Nevada County, California
USGS 3DEP LiDAR, CA_SierraNevada_B22 (2022, QL1), 116 M points in the AOI

0 1,000 2,000 3,000 ft

Scale 1:18,000 (all panels)

LEGEND

Canopy cover, 30 ft cells (first returns > 6.5 ft) Tree tops > 40 ft per acre, 100 ft cells

Dominant height (P95), 60 ft cells

Rumple index, 60 ft cells

THP plan area

Harvest unit

Watercourse (Class I / II)

STAND TABLE (canopy metrics from the 3 ft CHM; cover = cells >= 6.5 ft; tops = local maxima >= 15 ft)

Unit	Ac	Cover %	Mean canopy ht	P95 ht	Max ht	Tops/ac	Tops >40ft/ac	Rumple
1	175	88	66	116	180	38.4	30.9	3.15
2	184	96	74	125	189	37.3	31.8	3.65
3	29	97	96	140	194	32.6	31.5	3.29
4	42	91	81	118	162	34.2	33.1	3.12
5	31	99	64	103	151	40.8	38.4	2.35
6	27	100	95	142	200	31.6	31.0	3.09
7	47	96	87	140	201	34.8	31.5	3.20
Plan	624	93	76	128	201	36.5	31.5	3.29

NOTES

A: share of first returns above 6.5 ft in each 30 ft cell - the standard LiDAR canopy-cover definition. Plan-area mean 84 %.
B: 95th-percentile CHM height per 60 ft cell, a proxy for dominant tree height and site quality. Plan-area P95 128 ft; the tallest canopy (> 130 ft) follows the lower slopes above Deer Creek in units 3, 6 and 7; the shortest sits on the rocky south-facing ground of units 1 and 5.
C: detected tree tops taller than 40 ft per acre - an overstory stem-density surrogate (plan mean 31/ac). Low values inside dense canopy mean large, merged crowns rather than open ground.
Rumple = CHM surface area / planar area; higher values mean a rougher, more layered canopy (more structural complexity), useful for habitat and fuel assessment.
DEMONSTRATION: the LiDAR is real (USGS 3DEP, 2022) and every metric here is measured; the THP plan and units are illustrative. Compare to the simulated cruise with care.
