

Mosquito Fire, September 2022

Burn Severity - Extended Assessment

Placer and El Dorado counties, California - 76,788 ac (NIFC perimeter)
Sentinel-2 L2A, 20 m: pre-fire 2022-09-01, initial 2022-10-26, extended 2023-08-27

Scale 1:130,000

LEGEND

Burn severity, extended assessment (Aug 2023)

- Unburned / regrowth (dNBR < 100)
- Low (100-269)
- Moderate-low (270-439)
- Moderate-high (440-659)
- High (660+)

- Mosquito Fire perimeter (NIFC)
- National Forest (USFS) land

Roads (TIGER)

- Highway
- Main road
- Local road
- County line
- Town

SEVERITY WITHIN THE PERIMETER (dNBR, extended assessment 2023-08-27 vs 2022-09-01)

Class	Extended ac	%	Initial ac	%
Unburned / regrowth	11,449	15	14,343	19
Low	16,759	22	17,280	23
Moderate-low	13,355	17	14,587	19
Moderate-high	16,403	21	12,017	16
High	18,822	25	18,542	24

BY OWNERSHIP (extended assessment)

Owner	Acres	Unb %	Low %	M-low %	M-high %	High %
US Forest Service	52,509	15	23	18	21	24
Bureau of Land Management	1,343	7	17	18	29	29
State of California	318	8	20	12	16	45
Private / other	22,618	16	20	17	21	26

NOTES

dNBR = (NBR before - NBR after) x 1000, NBR = (NIR - SWIR2) / (NIR + SWIR2) from Sentinel-2 bands 8 and 12 at 20 m; class breaks after Key & Benson (2006). Cloud, shadow and snow masked with the L2A scene classification; 100 % of the perimeter is valid in the extended pair.
18,822 ac (25 %) burned at high severity and a further 16,403 ac (21 %) at moderate-high, together 46 % of the fire. Severity peaks in the 2,000-4,000 ft band on the Middle Fork American River canyon slopes. Extended assessment (one growing season later) is the standard for vegetation mortality; the initial assessment on sheet 2 shows where mortality was still developing.
DEMONSTRATION built from public data; not an official BAER or MTBS product. MTBS publishes the Demonstration built entirely from public data
Date: September 06, 2026 Projection: WGS 84 / UTM zone 10N (EPSG:32610) Method: dNBR (Key & Benson 2006), see notes
